

Module 01:

“The SOLID Principles”

SOLID

Beautiful, cartoonish illustrations by Ugonna Thelma from "[THE S.O.L.I.D. PRINCIPLES IN PICTURES](#)"

Agenda

- ▶ Introducing SOLID
- ▶ Single Responsibility Principle (SRP)
- ▶ Open/Closed Principle (OCP)
- ▶ Liskov's Substitution Principle (LSP)
- ▶ Interface Segregation Principle (ISP)
- ▶ Dependency Inversion Principle (DIP)
- ▶ Summary

Discussion Point:

Which SOLID Principles do you already know
(and love)?

SOLID is...

- ▶ ... Five fundamental “commandments” for OOP
- ▶ ... Coined by Robert C. Martin a.k.a. “Uncle Bob”
- ▶ ... Programming language-agnostic
- ▶ ... Not a framework or package!

- ▶ ... Maintainability!

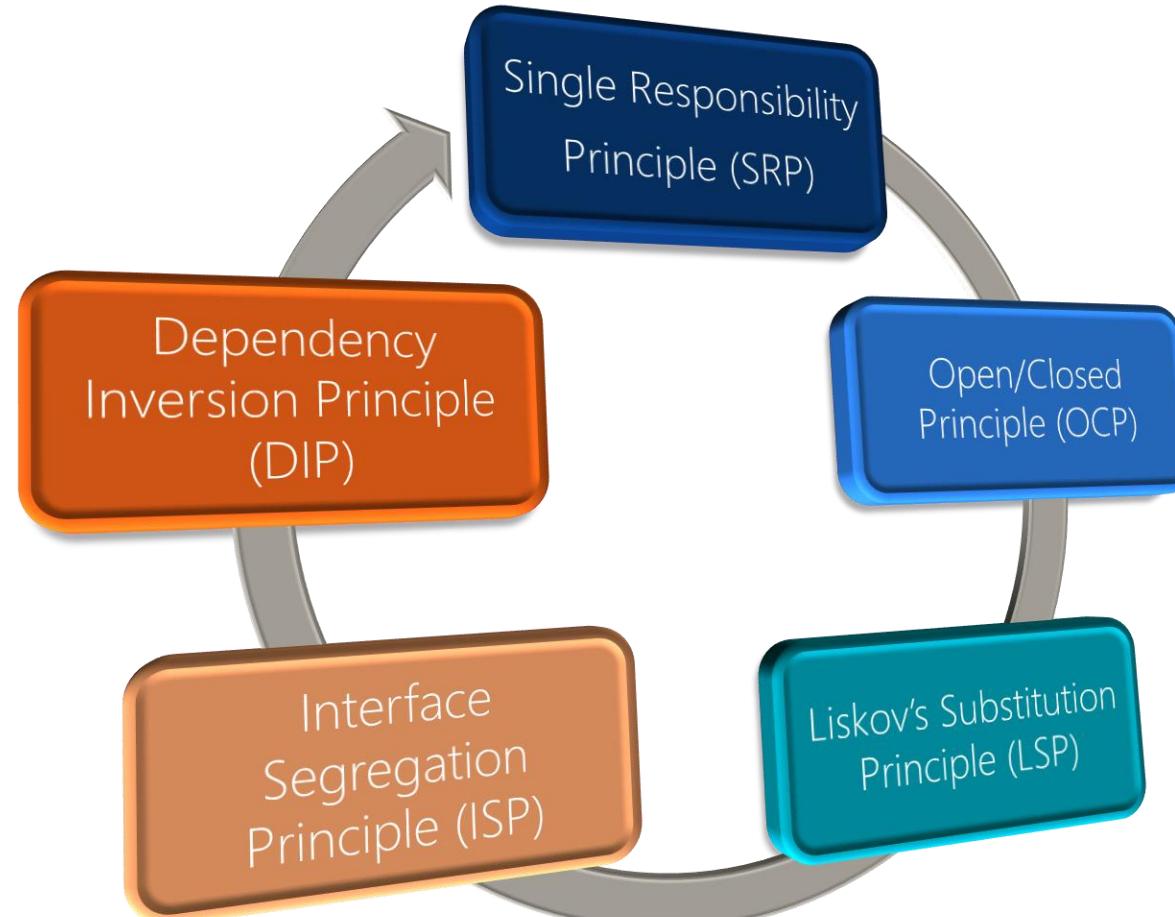

*"Always code as if the
guy who ends up
maintaining your code
will be a violent
psychopath who
knows where you live"*

- John F. Woods (1991)

The Five Principles of SOLID

Agenda

- ▶ Introducing SOLID
- ▶ **Single Responsibility Principle (SRP)**
- ▶ Open/Closed Principle (OCP)
- ▶ Liskov's Substitution Principle (LSP)
- ▶ Interface Segregation Principle (ISP)
- ▶ Dependency Inversion Principle (DIP)
- ▶ Summary

Single Responsibility Principle (SRP)

Each class should only have a single responsibility.

Each class should have only one reason to change

What Does That Mean Exactly?

For each class there should be only one requirement which, when changed, incurs a change to that class

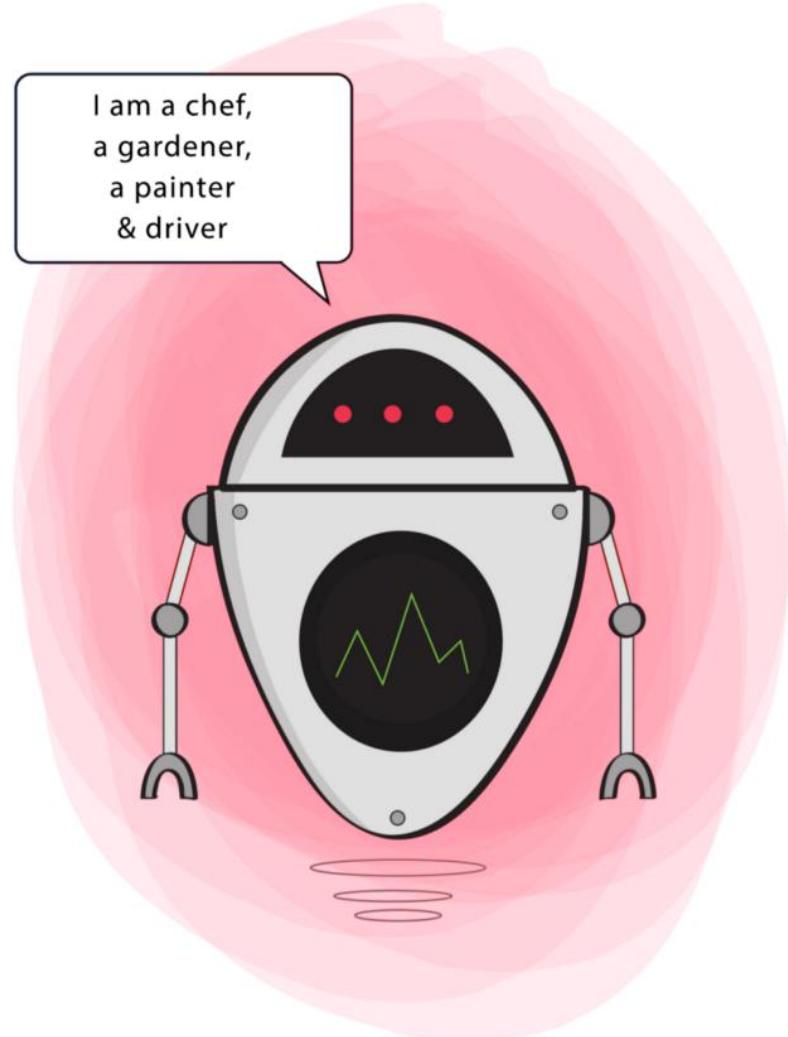

Discussion Point:

Do we now fully obey the Single Responsibility Principle?

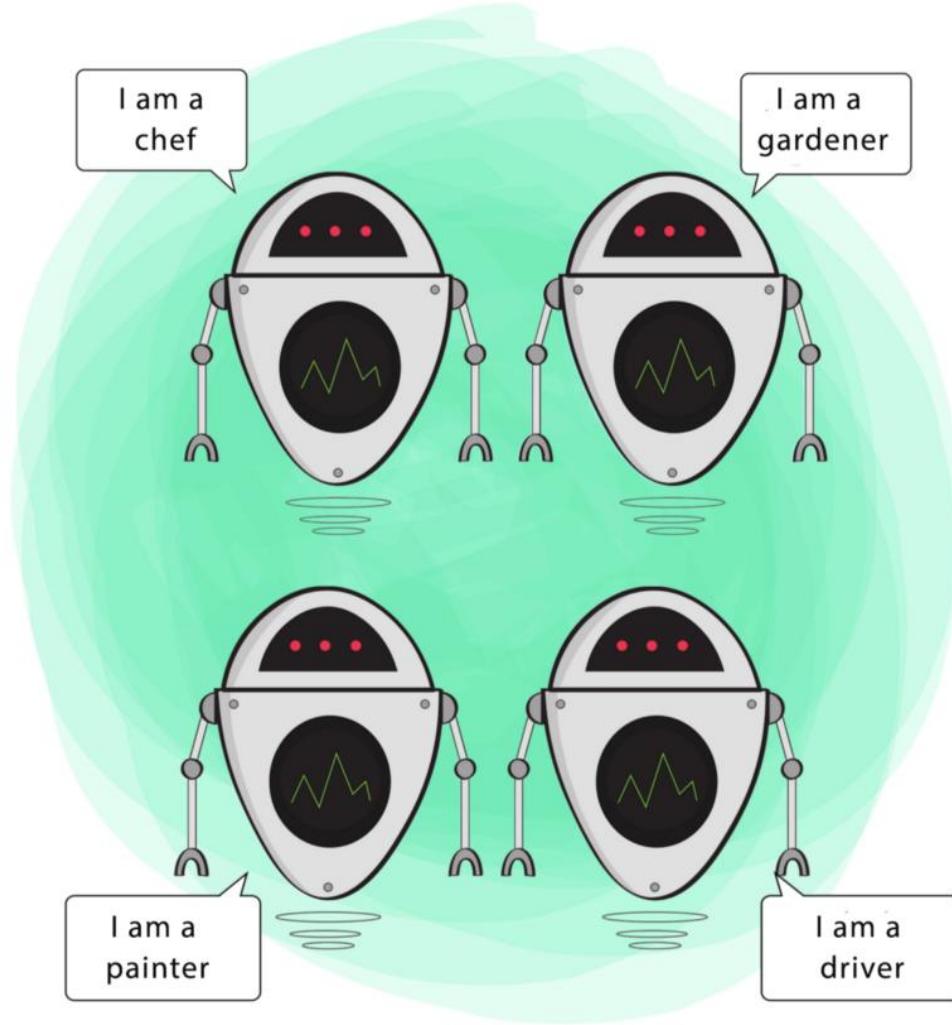

SRP in Summary

- ▶ Idea
 - Avoid God classes and Swiss army knife classes
- ▶ Why?
 - Small classes are easy to understand, modify, and debug
 - Small classes are hard to get wrong ☺
 - Supports team collaboration
- ▶ Consequences
 - 4-5 times more classes – but small, simple classes!
 - Functionality will appear as classes

Single Responsibility

Agenda

- ▶ Introducing SOLID
- ▶ Single Responsibility Principle (SRP)
- ▶ **Open/Closed Principle (OCP)**
- ▶ Liskov's Substitution Principle (LSP)
- ▶ Interface Segregation Principle (ISP)
- ▶ Dependency Inversion Principle (DIP)
- ▶ Summary

Open/Closed Principle (OCP)

Software entities should be open for extension, but closed for modification

What Does That Mean Exactly?

When a class is done, it is done!

You add new functionality.

You derive from existing functionality.

You plug in new functionality into existing.

There should be no cascading modifications throughout classes!

Abstract Base Classes or Interfaces?

- ▶ Bertrand Meyer's original definition
 - Based on (abstract) classes and inheritance
 - Can lead to quirky and multiple levels of inheritance
 - Puts large responsibility on author of base class
- ▶ The modern interpretation (a.k.a. "Polymorphic")
 - Interfaces
 - Allows swapping out complete implementations to avoid quirkiness

OCP in Summary

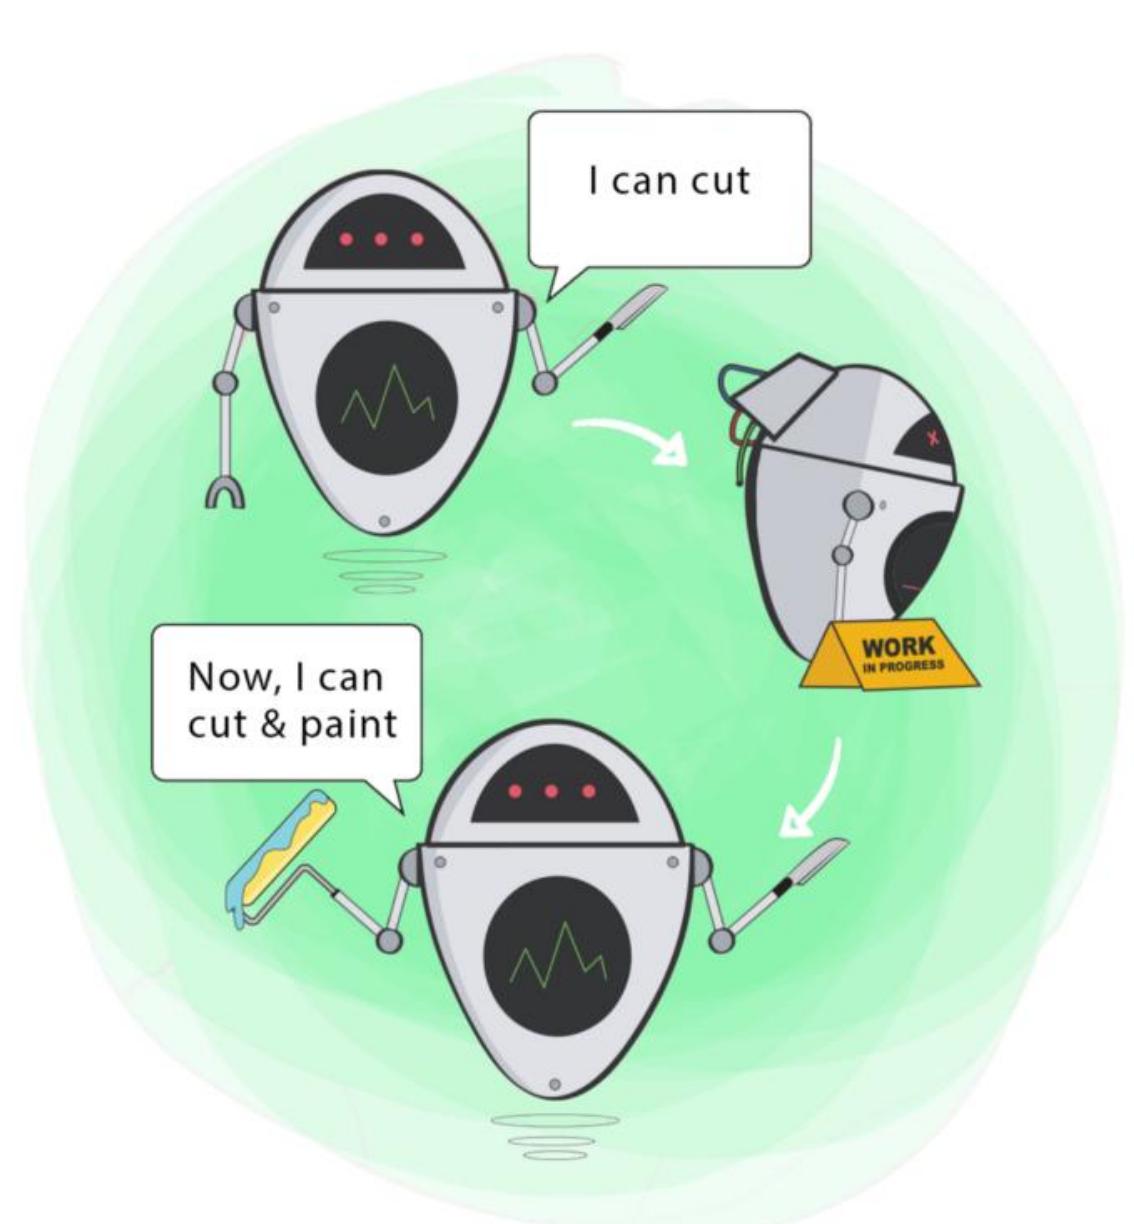

- ▶ Idea
 - Add, derive or plug-in new functionality without changing existing classes
- ▶ Why?
 - Everything that worked before still works!
 - No accidental errors to existing code
 - Easier to locate newly introduced errors
 - Supports team collaboration
- ▶ Consequences
 - Changes are easy to locate and review
 - Existing tests still work when new requirements are added

✗

Open-Closed

✓

Illustration by Ugonna Thelma from "THE S.O.L.I.D. PRINCIPLES IN PICTURES"

Agenda

- ▶ Introducing SOLID
- ▶ Single Responsibility Principle (SRP)
- ▶ Open/Closed Principle (OCP)
- ▶ **Liskov's Substitution Principle (LSP)**
- ▶ Interface Segregation Principle (ISP)
- ▶ Dependency Inversion Principle (DIP)
- ▶ Summary

Liskov Substitution Principle (LSP)

If S is a subtype of T , then objects of type T may be replaced with objects of type S without breaking the program

What Does That Mean Exactly?

Any derived class should be substitutable for its base class.

When you add new functionality, don't make any changes which cause existing code to break.

Essentially: "Behave well!"

LSP Variance Rules ~ Signature

- ▶ Contravariance of the method arguments in a subtype
- ▶ Covariance of the method return type in a subtype
- ▶ No new exceptions can be thrown by the subtype (unless they are part of the existing exception hierarchy)

Discussion Point:

Are we – at this point – obeying the Liskov Substitution Principle?

Why?

LSP Contract Rules ~ Behavior

- ▶ Preconditions cannot be strengthened in a subtype
- ▶ Postconditions cannot be weakened
- ▶ Invariants of the base type must be preserved in a subtype
- ▶ History constraint: Mutability vs. Immutability

But...

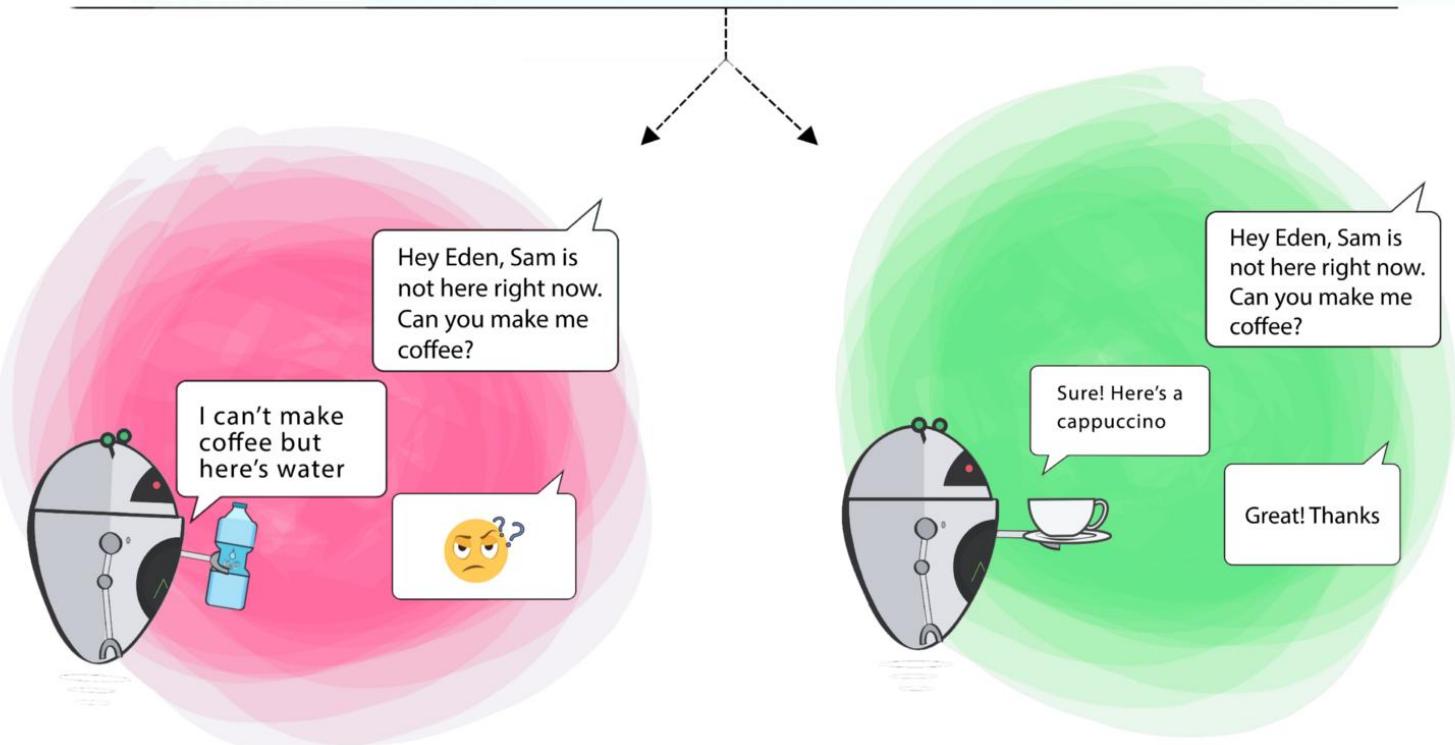

- ▶ What about (pure) abstract base classes?
- ▶ What about interfaces?
- ▶ They have no existing implementation!

LSP in Summary

- ▶ Idea
 - Make sure your subtypes behave well within the existing program
- ▶ Why?
 - Due to OCP you will swap functionality all the time.
 - Swapping in new functionality should not break your program
 - Essentially, LSP is a vital enabler for the other SOLID rules
- ▶ Consequences
 - Must implement all methods and properties in subclasses in the "spirit" of the existing program
 - Understand (and respect) the data invariants of the base classes
 - Nothing breaks...! ☺

X

Liskov Substitution

✓

Agenda

- ▶ Introducing SOLID
- ▶ Single Responsibility Principle (SRP)
- ▶ Open/Closed Principle (OCP)
- ▶ Liskov's Substitution Principle (LSP)
- ▶ **Interface Segregation Principle (ISP)**
- ▶ Dependency Inversion Principle (DIP)
- ▶ Summary

Interface Segregation Principle (ISP)

A client should not be forced to depend upon methods it doesn't use

What Does That Mean Exactly?

Break interfaces into smaller, more focused interfaces.

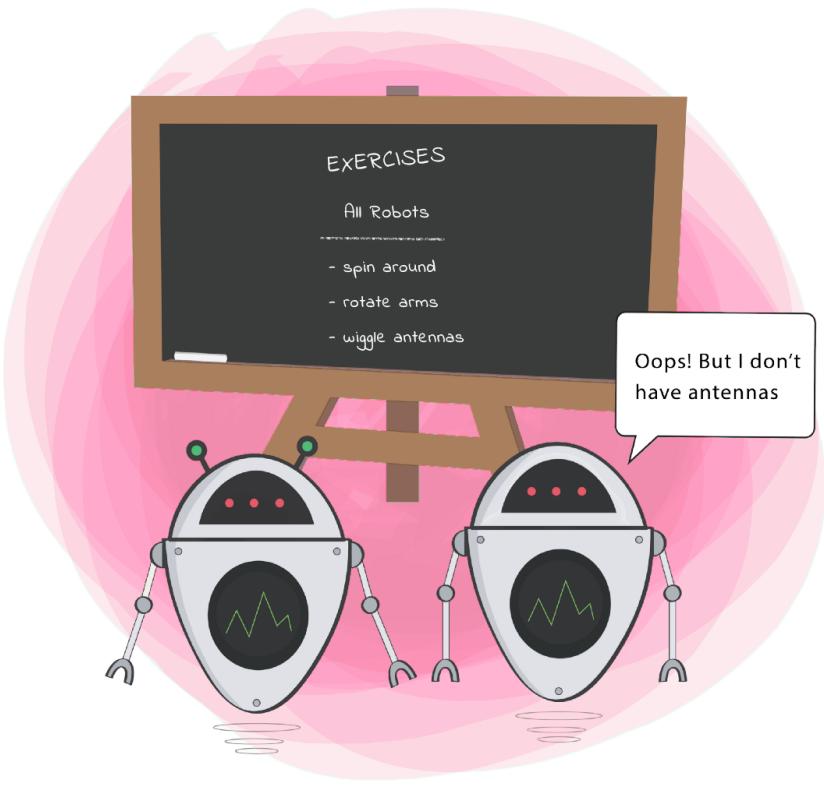

(Can still combine smaller interfaces using interface inheritance, though)

ISP in Summary

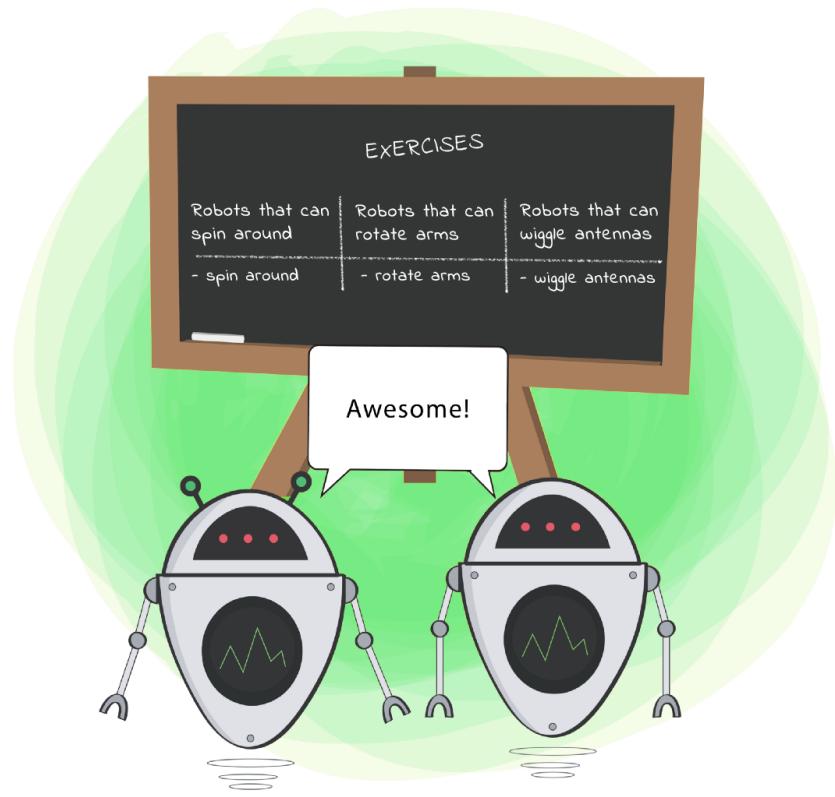

- ▶ Idea
 - Make your interfaces small and focused
 - This includes method parameters as well!
- ▶ Why?
 - Bloated interfaces probably violate SRP (or LSP)
 - Prevents references to unused dependencies
- ▶ Consequences
 - Interfaces become easier to implement
 - Classes and components have fewer dependencies

✗

Interface Segregation

✓

Agenda

- ▶ Introducing SOLID
- ▶ Single Responsibility Principle (SRP)
- ▶ Open/Closed Principle (OCP)
- ▶ Liskov's Substitution Principle (LSP)
- ▶ Interface Segregation Principle (ISP)
- ▶ **Dependency Inversion Principle (DIP)**
- ▶ Summary

Dependency Inversion Principle (DIP)

High-level modules should not depend on low-level modules. Both should depend on abstractions.

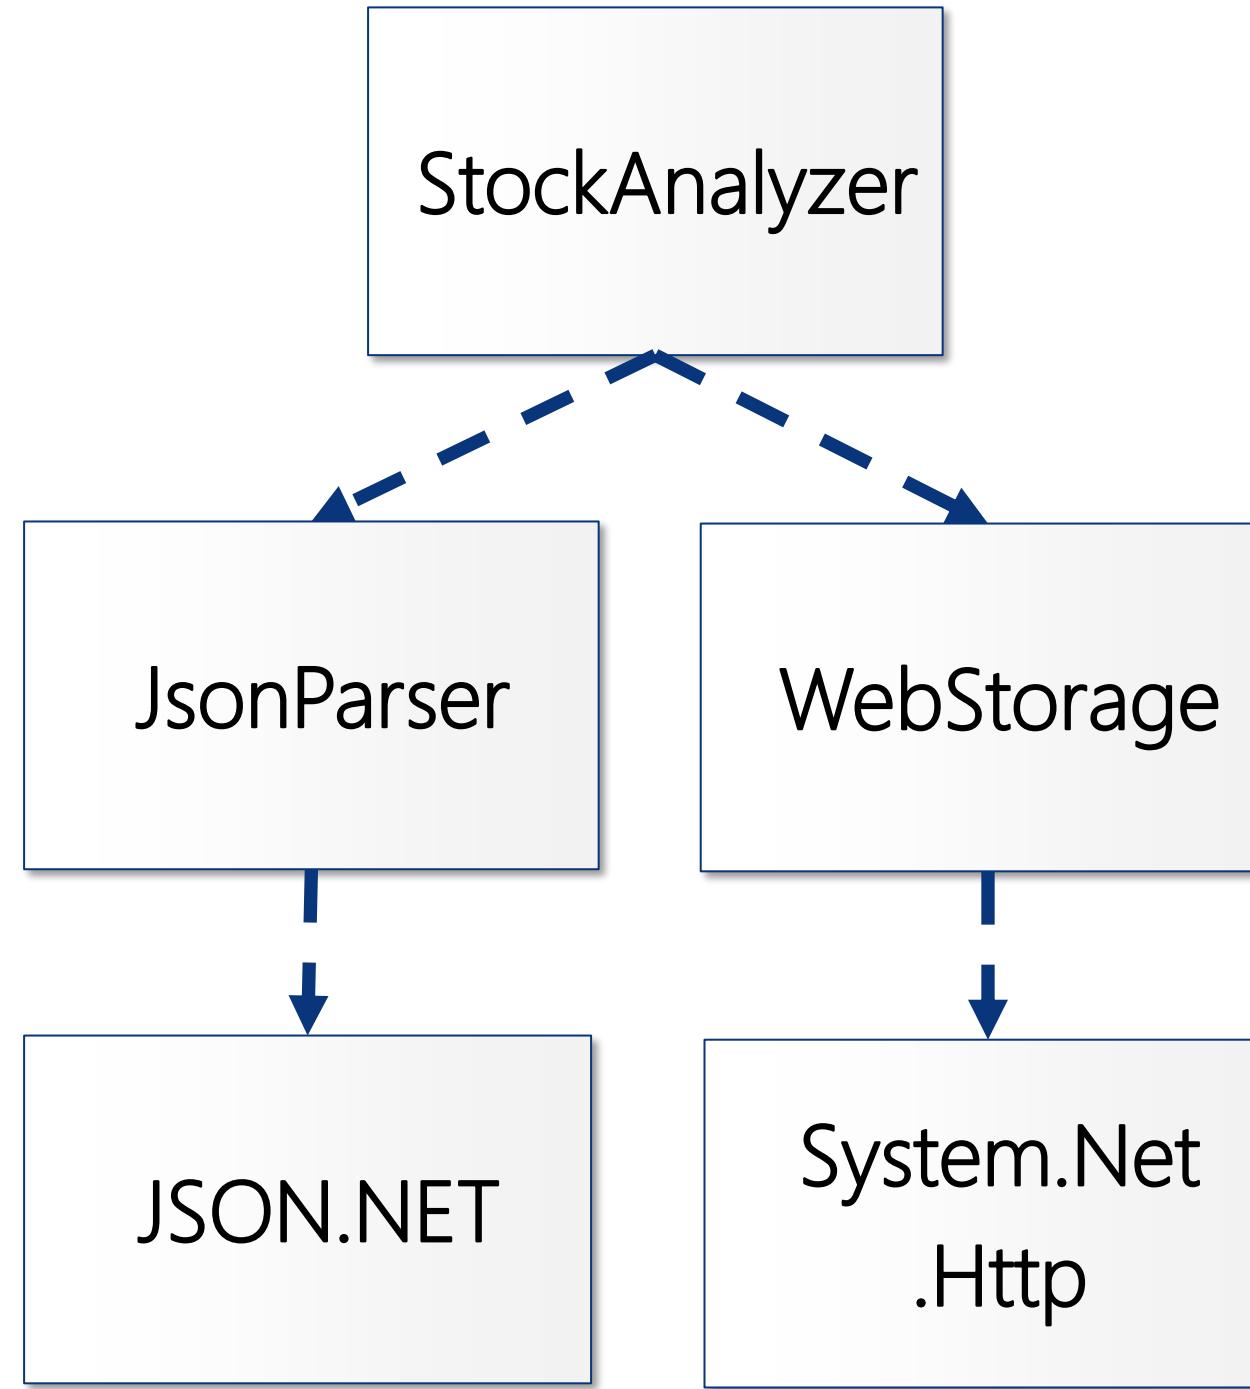

Abstractions should not depend upon details. Details should depend upon abstractions.

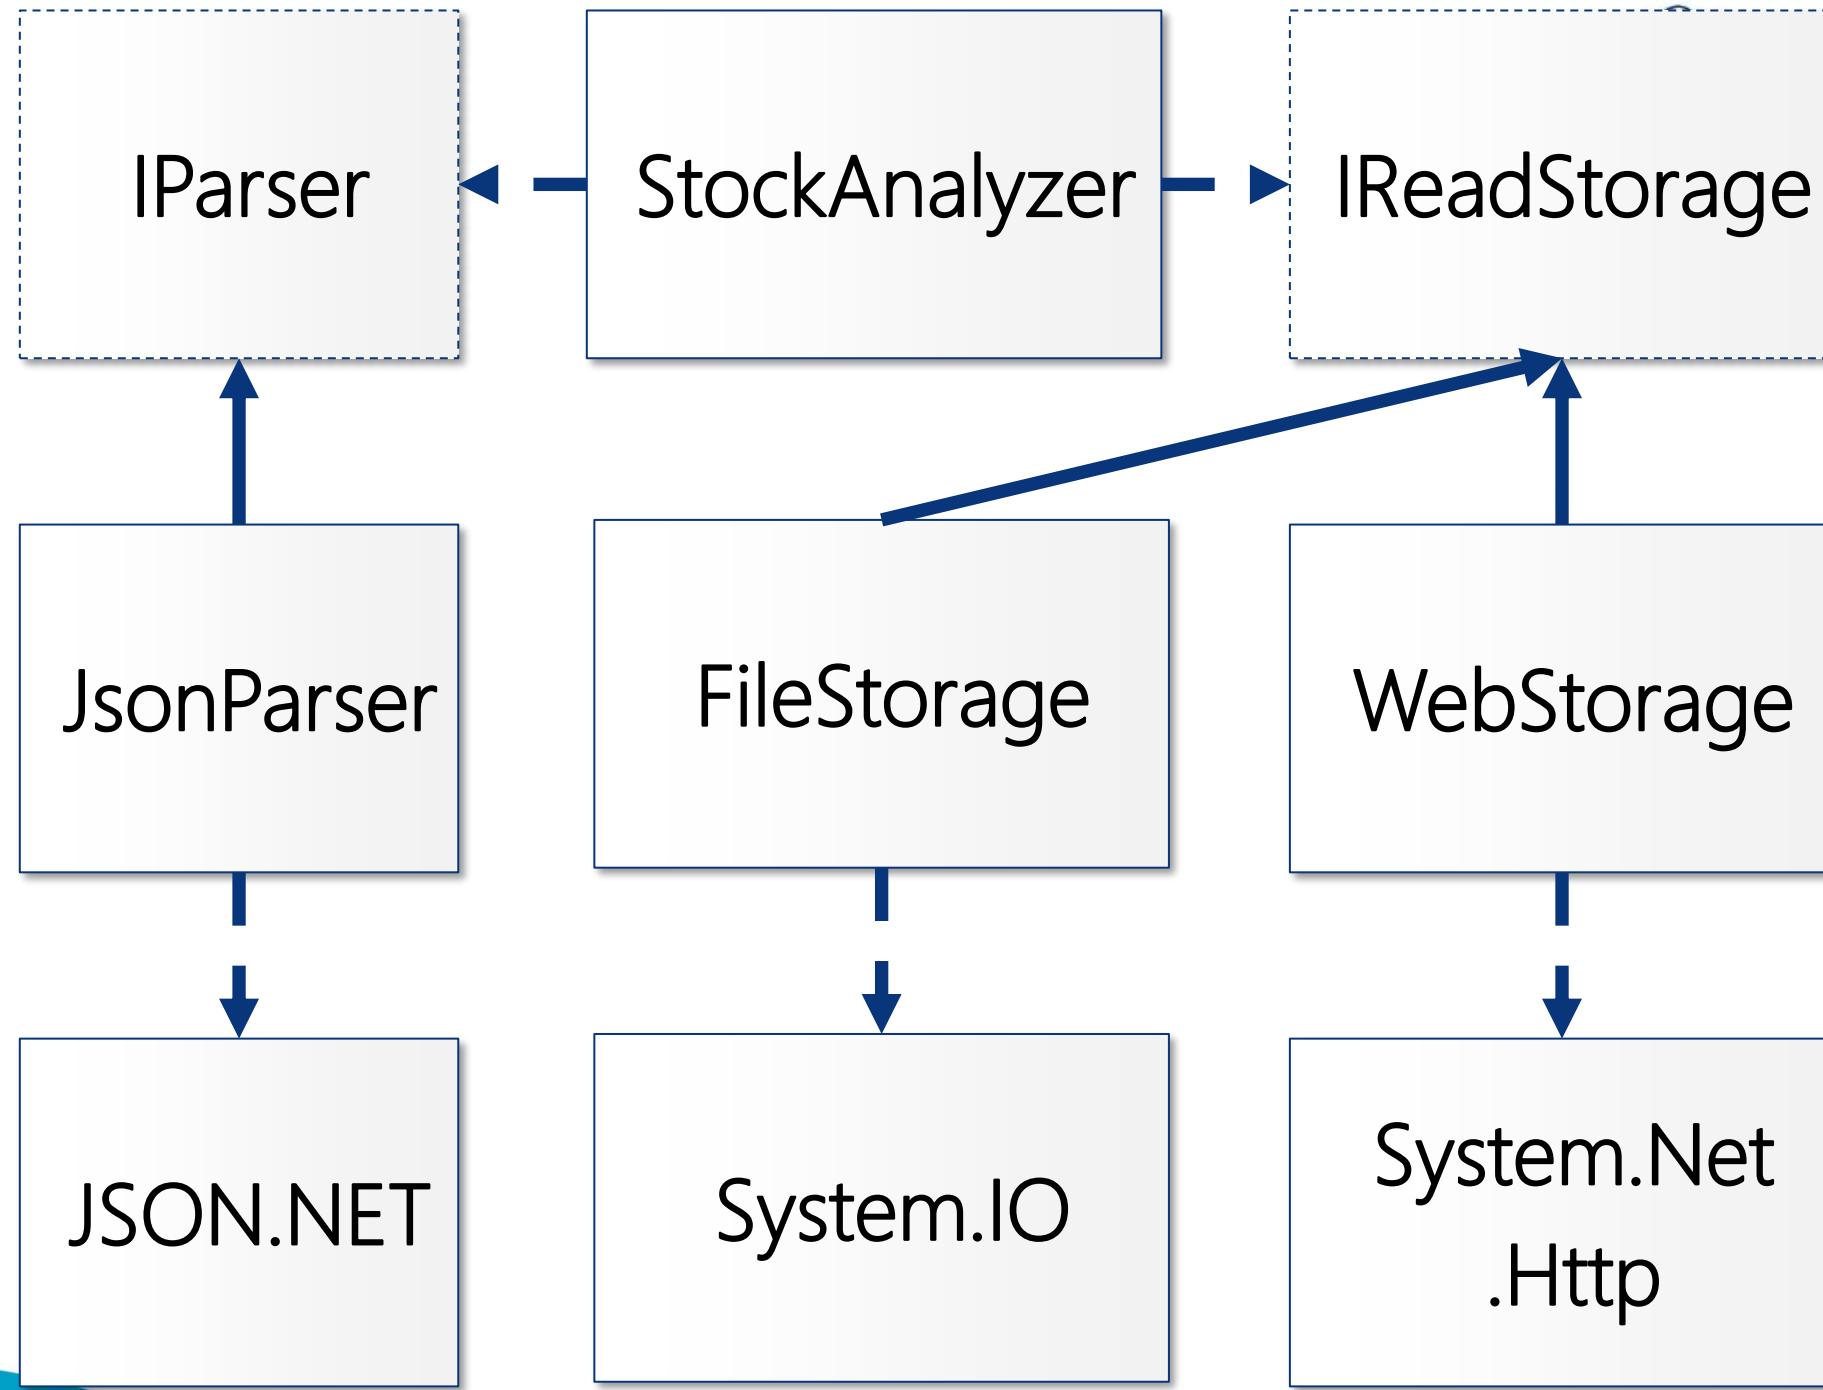

What Does That Mean Exactly?

Ensure that your classes do not depend upon specific implementations. Then you have the freedom to freely swap implementations and behavior.

A class' dependencies are supplied to the class – not created by the class itself!

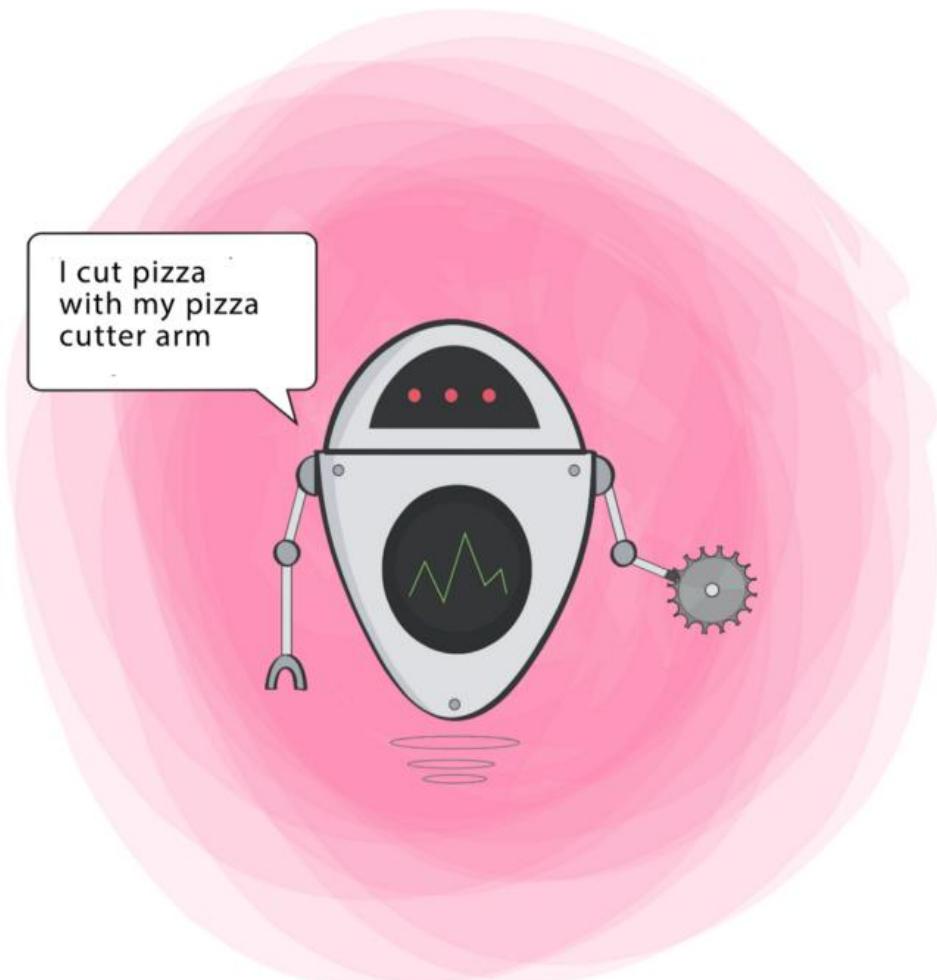

DIP in Summary

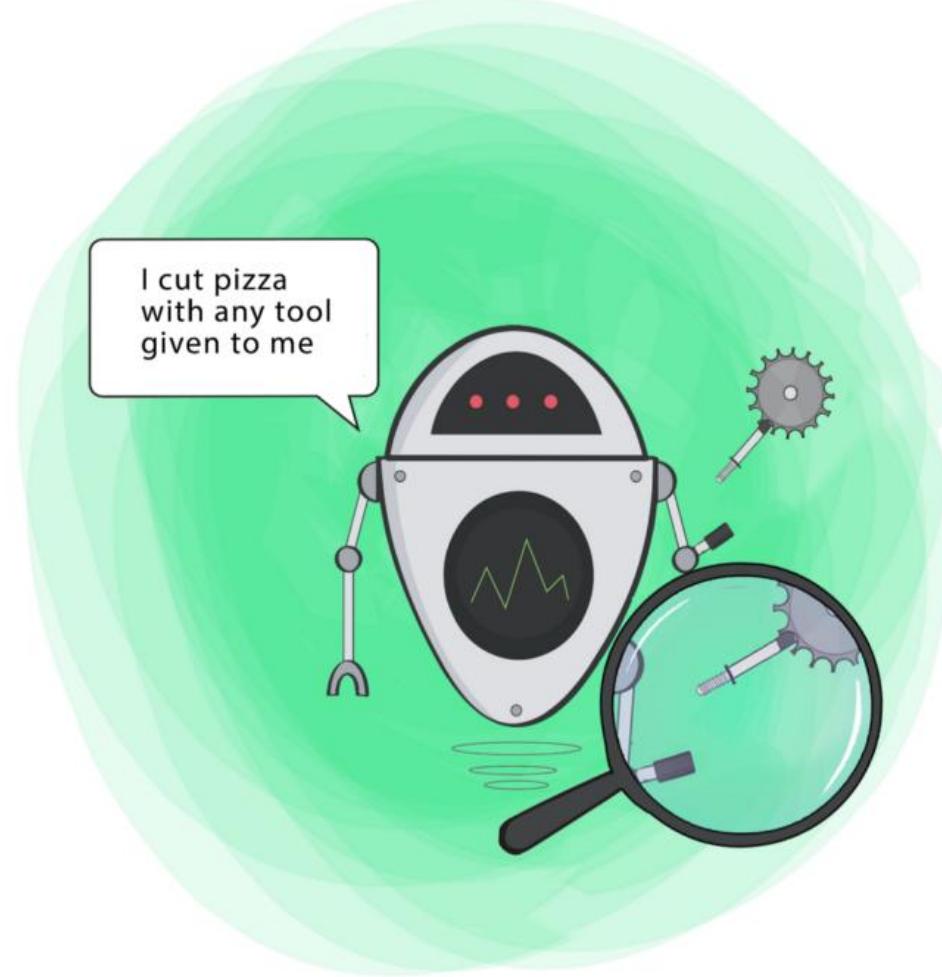

- ▶ Idea
 - Don't depend on concrete implementations! Only depend upon abstractions
 - Feed the dependencies needed into a class' constructor
- ▶ Why?
 - Maximize freedom to change implementations, because a class will never depend upon specific implementations – only their abstraction
 - Testability
 - Minimize dependencies and dependencies' dependencies
- ▶ Consequences
 - Classes will become loosely coupled
 - Your program becomes eligible for Dependency Injection

✗

Dependency Inversion

✓

Summary

- ▶ Introducing SOLID
- ▶ Single Responsibility Principle (SRP)
- ▶ Open/Closed Principle (OCP)
- ▶ Liskov's Substitution Principle (LSP)
- ▶ Interface Segregation Principle (ISP)
- ▶ Dependency Inversion Principle (DIP)
